Mobile Asset Assistant

Asset Management in the Palm of Your Hand

The ability to step away from a desk or computer to perform specific tasks is sometimes required when managing a communications operation. Certain activities such as audits of remote locations or receiving and entering shipments of new assets into the system cannot be done from a stationary position. In many cases however, communications professionals find themselves collecting information by hand then entering this information into a computer when they return to their desk, therefore creating unnecessary steps in the workflow process. To combat this, MCM created the Mobile Asset Assistant Enhancement App, or *MAA*.

The MAA app gives users direct access to many of the asset management functions in the Core Application through a mobile computing, barcode scanning device. This application allows all asset records to be synced and downloaded to the device (via cradle or wireless network) before the remote activities begin. Once synced, the handheld app provides a simplified way of capturing, tracking, and managing all assets while on the go. Using the MAA app, users can perform audits of locations, updates to individual and multiple asset records, and exchanges (swaps) of serialized equipment using barcode scanning technology. This allows operations to access the power of the Core Application anywhere they need it.

CORE APP COMPATIBILITY
CommSHOP 360º and CommASSET 360º

BASIC FUNCTIONALITY
- Electronically Audit Remote Sites without internet connectivity.
- Quickly add new assets to your inventory simply by scanning barcodes as items are received.
- Track assignment and location changes as they are performed from live in the field.
